

DQIIONAPI RELEASE NOTES

Subject: DQIIONAPI Release Notes

Date: 01/25/2021

Version: 1.0

DQIIONAPI v7.1.19

New version available in downloads - DQIIONAPI v7.1.19 (20210125)

1. Picked status can now be set. When the stage = 2, then the specified status will be set on the order.
 - a. Found under Group Options – Status tab.

DQIIONAPI v7.1.17

New version available in downloads – DQIIONAPI v7.1.17 (20200813)

1. Fixed bug: when building includeshipvialist or excludeshipvialist, the results from both the ship via list and the ship via changed list should be combined with a comma separating them, which they were not, but should be now.

DQIIONAPI v7.1.16

New version available in downloads – DQIIONAPI v7.1.16 (20200803)

1. Multiple attempts to call the ION API has been added.
 - a. By default, 2 attempts will be made before erroring out.
 - b. For Ship/Unship writeback and GetStage calls, 5 attempts will be made before erroring out.

DQIIONAPI v7.1.15

New version available in downloads – DQIIONAPI v7.1.15 (20200729)

1. Option to set the closed flag on orders after they have been successfully shipped via the Sx API Ship/Unship call.
 - a. Found under Import 2 tab.

DQIIONAPI v7.1.14

New version available in downloads - DQIIONAPI v7.1.14 (20200416)

1. The sxapiOEHeaderUpdate API call will clear out the drdeldt and drdelmt fields whenever a certain field (pmfl, relateddocument, route, shipviaty and user1 – user24) is updated. In order to prevent that, when one of these fields is identified as being an updated field, a call is made to the OEGetSingleOrder API call to retrieve the current values for drdeldt and drdelmt. These values are then included in the update call so that they no longer appear to be cleared out on the order header record.

DQIIONAPI v7.1.13

New version available in downloads – DQIIONAPI v7.1.13 (20200403)

1. ‘Delivered Time’ writeback added – the delivered date and time can be written to specified date and time fields. a. Found under Writeback tab.

DQIIONAPI v7.1.12

New version available in downloads – DQIIONAPI v7.1.12 (20200306)

1. New option. Include tax in amount – normally the amount field holds the sell amount and the tax field holds the tax amount. But some customers want the amount field to contain the invoice amount, which is the amount + tax.
 - a. Found under Import 1 tab -> ‘Include tax in amount’
 - b. In addition, if this option is selected and the order is a COD, the tax will not be removed from the CODCollAmount, which it normally would be.
2. Query ION options have been updated:
 - a. Query Single Order – this now queries directly from the table so that all fields in table should be shown now.
 - b. Query Delivery Orders – can now run the same query that the delivery import runs

DQIIONAPI v7.1.11

New version available in downloads – DQIIONAPI v7.1.11 (20200224)

1. Bug fix – sub warehouses not showing in warehouse filter.

DQIIONAPI v7.1.5

New version available in downloads - DQIIONAPI v7.1.5 (20190926)

1. POS Connection format has changed. It should now match the values found in the .ionapi settings file (iu, pu, ot, etc.).
 - a. After you upgrade to this version, make sure you update the existing values in those fields to match. For example, Owner Token (ot) is a new field that was added and should be filled.
2. Query ION - you can now query OE, WT and PO orders from the ION database. This is mainly for troubleshooting.
 - a. Found under Admin, POS Connections tab -> Query ION button.
